Multiplication and Division Examples BCD

## Multiplication and Division

Table 2.1 Summary of 68HC12 multiply and divide instructions

| Mnemonic | Function | Operation |
| :---: | :---: | :---: |
| EMUL | unsigned 16 by 16 multiply | $(\mathrm{D}) \times(\mathrm{Y}) \rightarrow \mathrm{Y}: \mathrm{D}$ |
| EMULS | signed 16 by 16 multiply | $(\mathrm{D}) \times(\mathrm{Y}) \rightarrow \mathrm{Y}: \mathrm{D}$ |
| MUL | unsigned 8 by 8 multiply | $(\mathrm{A}) \times(\mathrm{B}) \rightarrow \mathrm{A}: \mathrm{B}$ |
| EDIV | unsigned 32 by 16 divide | $(\mathrm{Y}: \mathrm{D}) \div(\mathrm{X})$ quotient $\rightarrow$ Y remainder $\rightarrow$ D |
| EDIVS | signed 32 by 16 divide | $\begin{aligned} & \hline(\mathrm{Y}: \mathrm{D}) \div(\mathrm{X}) \\ & \text { quotient } \rightarrow \mathrm{Y} \\ & \text { remainder } \rightarrow \mathrm{D} \end{aligned}$ |
| FDIV | 16 by 16 fractional divide | $\begin{aligned} & \hline(\mathrm{D}) \div(\mathrm{X}) \rightarrow \mathrm{X} \\ & \text { remainder } \rightarrow \mathrm{D} \\ & \hline \end{aligned}$ |
| IDIV | unsigned 16 by 16 integer divide | $\begin{aligned} & \hline(\mathrm{D}) \div(\mathrm{X}) \rightarrow \mathrm{X} \\ & \text { remainder } \rightarrow \mathrm{D} \end{aligned}$ |
| IDIVS | signed 16 by 16 integer divide | $\begin{aligned} & \hline(\mathrm{D}) \div(\mathrm{X}) \rightarrow \mathrm{X} \\ & \text { remainder } \rightarrow \mathrm{D} \end{aligned}$ |

Example 2.10’ Write an instruction sequence to multiply the 16-bit numbers stored at $\$ 800-\$ 801$ and $\$ 802-\$ 803$ and store the product at $\$ 900-\$ 903$.

## Original Operands in Memory

| D | $2^{\text {st }}$ operand LSB | \$803 |
| :---: | :---: | :---: |
|  | $2^{\text {st }}$ operand MSB | \$802 |
| Y | $1^{\text {st }}$ operand LSB | \$801 |
|  | $1^{\text {st }}$ operand MSB | \$800 |

## Product in Memory

| LSBs | \$903 |
| :---: | :---: |
|  | \$902 |
|  | \$901 |
| MSBs | \$900 |

;load $1^{\text {st }}$ operand into Y
;load $2^{\text {nd }}$ operand into D
; Multiplying the numbers assuming unsigned numbers
;storing the upper 16 bits
;storing the lower 16 bits

Example 2.11 Write an instruction sequence to divide the signed 16-bit number stored at $\$ 1005-\$ 1006$ by the signed 16 -bit number stored at $\$ 1020-\$ 1021$ and store the quotient and remainder at $\$ 1030-\$ 1031$ and $\$ 1032-\$ 1033$, respectively.

## Illustration of 32-bit by 32-bit Multiplication

- Two 32-bit numbers M and N are divided into two 16-bit halves

$$
\mathrm{M}=\mathrm{M}_{\mathrm{H}} \mathrm{M}_{\mathrm{L}}
$$

$$
\mathrm{N}=\mathrm{N}_{\mathrm{H}} \mathrm{~N}_{\mathrm{L}}
$$

Note: msb stands for most significant byte and lsb for least significant byte
Figure 2.3 Unsigned 32-bit by 32-bit multiplication

## Example 2.12 Write a program to multiply two unsigned 32-bit numbers

 stored at $\mathrm{M} \sim \mathrm{M}+3$ and $\mathrm{N} \sim \mathrm{N}+3$, respectively and store the product at $\mathrm{P} \sim \mathrm{P}+7$.
## Solution:

|  | Org | \$1000 |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| M | ds.b | 4 | ;Multiplicand 4 bytes |  |  |  |  |  |
| N | ds.b | 4 | ;Multiplier 4 bytes |  |  |  |  |  |
| P | ds.b | 8 | ;Product 8 bytes | 16-bit | 16-bit | 16-bit | 16-bit |  |
|  | Org | \$1500 |  |  |  |  | lower half |  |
|  | ldd | M+2 | ;place $\mathrm{M}_{\mathrm{L}}$ in D |  |  | upper half | lower half | partial product $\mathrm{M}_{\mathrm{L}} \mathrm{N}_{\mathrm{L}}$ |

## BCD Numbers and Addition

- Each digit is encoded by 4 bits
- Two digits are packed into one byte
- The addition of two BCD numbers is performed by binary addition and an adjust operation using the DAA instruction.
- The instruction DAA can be applied after the instructions ADDA, ADCA, and ABA.
- Simplifies I/O conversion

For example, the instruction sequence

| LDAA | $\$ 800$ |
| :--- | :--- |
| ADDA | $\$ 801$ |
| DAA |  |
| STAA | $\$ 802$ |

adds the BCD numbers stored at $\$ 800$ and $\$ 801$ and saves the sum at $\$ 802$.

Example 2.13’ Write a program to convert the 16 -bit number stored at $\$ 800-\$ 801$ to BCD format and store the result at $\$ 900-\$ 904$. Convert each BCD digit into its ASCII code and store it in one byte.

## Solution:

- A binary number can be converted to BCD format by using repeated division by 10.
- The largest 16-bit binary number is 65535 which has five decimal digits.
- The first division by 10 obtains the least significant digit, the second division by 10 obtains the second least significant digit, and so on.

|  | org | \$800 |  |
| :---: | :---: | :---: | :---: |
| data | dc.w | 12345 | ; data to be tested |
|  | org | \$900 |  |
| result | ds.b | 5 | ; reserve bytes to store the result |
|  | org | \$1000 |  |
|  | ldd | data |  |
|  | ldy | \#result |  |
|  | ldx | \#10 |  |
|  | idiv |  |  |
|  | addb | \#\$30 | ; convert the digit into ASCII code |
|  | stab | 4,Y | ; save the least significant digit |
|  | xgdx |  |  |
|  | ldx | \#10 |  |

| idiv <br> adcb <br> stab <br> xgdx <br> ldx | $\# \$ 30$ |  |
| :--- | :--- | :--- |
| idiv | $\# 10$ | ; save the second to least significant digit |
| addb | $\# \$ 30$ |  |
| stab | $2, Y$ |  |
| xgdx |  |  |
| ldx <br> idiv <br> addb | $\# 10$ | ; save the middle digit |
| stab | $1, Y$ |  |
| xgdx <br> addb | $\# \$ 30$ | ; save the second most significant digit |
| stab | $0, Y$ |  |
